CHAPTER 16 RELATIVITY—MOMENTUM, MASS, ENERGY, AND GRAVITY 303 16.1 Momentum and Inertia in Relativity If we push an object that is free to move, it will accelerate. If we maintain a steady push, it will accelerate to higher and higher speeds. If we push with a greater and greater force, we expect the acceleration in turn to increase.

These momenta must be equal because of the conservation of momentum, and therefore
$$M_0 = 2m_w$$
 The mass of the object which is formed when two equal objects collide must be twice the mass of the objects which come together. You might say, "Yes, of course, that is the conservation of mass."

When a mass is moving relative to an observer, the only way that its mass can be determined is through collisions or other means in which momentum is involved. Since the mass of a moving object cannot be determined independently of momentum, the only meaningful mass is rest mass.

Conceptual PhysicsReading and Study Workbook N Chapter 16 125 Summary According to special relativity, mass and energy are equivalent. According to general relativity, gravity causes space to become curved and time to undergo changes. 16.1 Momentum and Inertia in Relativity As an object approaches the speed of light, its momentum increases dramatically.

Summary

Relativistic momentum is given as $\gamma m_0 v$ $\gamma = \frac{1}{\sqrt{1 - \frac{v^2}{c^2}}}$ where m_0 is the object's invariant mass and γ is Lorentz transformation.

Figure 5.23 Momentum is an important concept for these football players from the University of California at Berkeley and the University of California at Davis. A player with the same velocity but greater mass collides with greater impact because his momentum is greater. For objects moving at relativistic speeds, the effect is even greater.

Relativistic Momentum In this setion we will turn to a discussion of some interesting aspects of Special Relativity, concerning how particle and objects gain motion, and how they interact. In this section we will arrive at an expression that looks something like the definition of momentum, and seems to be a conserved quantity under the new ...

September 16, 2008 Abstract I describe how relativistic eld theory generalises the de ning prop-erty of material systems to possess mass to the requirement of them having a mass-energy-momentum density tensor T (energy tensor for short) associated with them. I argue that according to general relativity T

The nature and origin of the photon and elementary rest masses are some of the challeng-ing problems that physics face. The approaches used to solve these problems are complex and time-consuming. Specifically, the photon rest mass pays attention to theoretical physi-cists. Many experimental works show that the photon rest mass is non zero.
