Linear referencing in the ESRI®ArcGIS™ Desktop products
suite—ArcView®, ArcEditor™, and ArcInfo™—enables users to
create, manage, display, query, and analyze data whose relative
position has been modeled along a linear feature. Linear

referencing in ArcView allows users to display and query route and event data.

Right-click the Calibrate Routes tool in the Linear Referencing toolbox and click Open. Type C:\MyLR\PITT.gdb\PITT\routes for the value of the Input Route Features parameter. Click the Route Identifier Field drop-down arrow and click ROUTE1. The values in the Route Identifier Field uniquely identify each route.

**Exercise 2: Creating and calibrating route data - ArcGIS** Linear referencing is a method of storing distance and temporal data that adds a new dimension to line features. Learn linear referencing concepts and how to create and edit the data required for linear referencing-based mapping and analysis.

**Getting Started with Linear Referencing | Esri Training ...** When data is linearly referenced, multiple sets of attributes can be associated with any portion of an existing linear feature, independent of its beginning and end. These attributes can be displayed, queried, edited, and analyzed without affecting the underlying linear feature's geometry.

Linear referencing is also used to associate multiple sets of attributes to portions of linear features without requiring that  $\frac{1}{Page} \frac{1}{7/10}$ 

underlying lines be segmented (split) each time that attribute values change. For example, most road centerline feature classes are segmented where three or more road segments intersect and where the road names change.
