M1 Tank Engine

The M1 Abrams is a third-generation American main battle tank designed by Chrysler Defense (now General Dynamics Land Systems). Conceived for modern armored ground warfare and now one of the heaviest tanks in service at nearly 68 short tons (almost 62 metric tons), it introduced several innovative features, including a multifuel turbine engine, sophisticated Chobham composite armor, a computer fire control system, separate ammunition storage in a blow-out compartment, and NBC protection ...

The most recent M1 model holds 490 gallons (1,850 L), allowing the tank to go about 265 miles (426 km) without refueling. The turbine engine works with a range of fuels, including ordinary gasoline, diesel fuel and jet fuel. The engine provides power to a six-speed automatic hydrokinetic transmission (that's four forward gears and two reverse gears). The transmission turns sprockets on either side of the tank.

COOLER M1 ABRAMS TANK ENGINES The goal of tank engine development has always been "more power". The M1A1 Abrams tank with its revolutionary gas turbine engine was designed to fight massed Soviet armor in a rapid, bloody confrontation. Fuel economy was not important since tanks were based less than 100 miles from the enemy.

U.S. army's main battle tank M1 Abrams is the only mass produced turbine powered land vehicle in the world. The decision to use gas turbines as the power source of the main battle tank was made in the circumstances that applying gas turbines to the tank was thought to be a wild scheme all over the world. In Soviet Union, main battle tank T80 adopted the gas turbine as its main power source but failed and next generation T90 was powered by diesels.

M1 crew members say that this is far and away the most comfortable position in the tank. The driver steers the tank using a motorcycle-style handlebar, and accelerates by twisting a handle grip throttle. The tank has a brake pedal on the floor, just like a car. The driver navigates using three periscopes (also called vision blocks).
