Slinky Wave Lab Background A wave can be described as an energy disturbance that travels through a medium from one location to another. Waves, simply put, are energy moving from one place to another. As the wave moves through the medium (water, slinky, air), energy is being passed from one particle to the next. Waves occur around us every day.

understand how seismic waves transfer energy as they travel through solids. All types of waves transmit energy, including beach waves, sound, light, and more. When an earthquake occurs it generates four different types of seismic waves.

Seismic Slinky: Modeling P and S waves

A slinky can easily demonstrate the two basic types of waves, longitudinal and transverse. In a longitudinal wave the particles move parallel to the direction the wave is moving. In a transverse wave the particles move at right angles to the direction of wave travel. There are three basic characteristics used to describe waves.

Something can be "heard" when sound waves from it enter the ear. Sound is a form of energy that is caused when vibrating materials produce waves that move through matter. The waves have different characteristics such as frequency and amplitude, which will determine the properties of sound such as pitch and loudness.
